

Appl. No. 10/604,015  
Amendment dated August 1, 2005  
Reply to Office Action of July 1, 2005

**Amendments to the Specification:**

[0064] The embodiment of Figs. 3 and 5 includes many features of Figs. 1 and 2, with a double latching means or retention mechanism between the inner and outer lids. As best shown in Fig. 5, the inner lid 40 includes a peripherally extending shoulder or channel follower 66 on inner top panel 42. The shoulder 66 extends laterally beyond side wall 24 at mouth 26. The lower face of panel 42 defines an engagement surface for a rib on the inside face of peripheral wall 56. Otherwise stated, above rib 68 the inside face of peripheral wall 56 defines a reception channel for channel follower 66. Thus, Fig. 5 shows that peripheral wall 56 includes two vertically spaced apart engaging devices, such as upper rib 68 and lower rib 70. These two ribs respectively engage below shoulder 66 and rib 28.
